PLANTING GUIDE FOR SUCCESSFUL RESULTS!
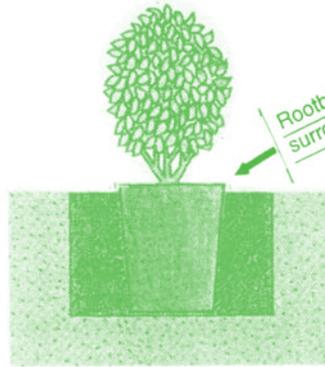

Rootball 1 inch above surrounding soil

1. Preparing the Planting Hole

Dig hole twice as wide as the container. (When the plant is placed into the hole, the top of the root ball should be 1 inch above the surrounding soil line. **Putting dirt on top of the original rootball will smother your plant!**
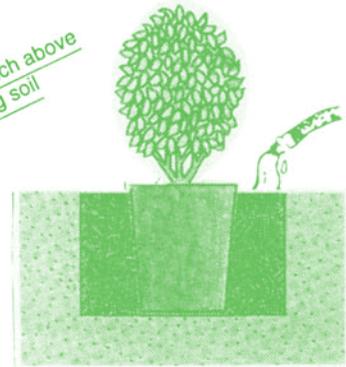

2. Container Removal

While holding the top of the soil ball, tap the top edge of the plastic container. The premoistened soil ball will slide out easily.

3. Planting

Be sure to set the plant 1 inch above the surrounding soil line, never deeper. Backfill around the rootball with *Lukas Potting Soil* or *Black Kow*. Add *Start-N-Grow* per directions while backfilling for a slow 3-4 month total feeding. Firm the soil while soaking with water to eliminate air pockets.

4. Feed / Water / Care

After planting is done apply *Root Stimulator* for quick nourishment and rapid root growth. Deep soak rootball 2 times a week until plant is established (usually 6-8 weeks), but *avoid a soggy soil condition, which will drown your plant.* For healthy rapid growth use *Lukas 4-in-One Fertilizer* two times a year. *You will love the results, Guaranteed!*
