LUKAS NURSERY PLANTING GUIDE FOR SUCCESSFUL RESULTS!

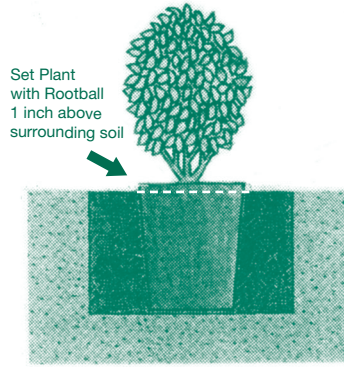

1. Preparing the Planting Hole

Dig hole wider than the container. When the plant is placed into the hole, **the top of the rootball should be 1 inch above the surrounding soil line.** (Putting dirt on top of the original rootball will smother your plant!)

2. Container Removal

While holding the top of the rootball, tap the top edge of the plastic container. The premoistened rootball will slide out easily.

3. Planting

Be sure to set the plant 1 inch above the surrounding soil line, never deeper. Backfill around the rootball with Lukas Premium Potting Mix or Black Kow. Add Start-N-Grow and Pre-Plant per directions while backfilling. Firm the soil while soaking with water to eliminate air pockets.

4. Feed / Water / Care

After planting is done, apply Root Stimulator for quick nourishment and rapid root growth. **Deep soak rootball 2-3 times a week until plant is established** (usually 6-8 weeks), but **avoid a soggy soil condition, which will drown your plant.** For healthy rapid growth use Lukas 4-in-One Fertilizer two to three times a year.
